Metrics Calculation Reference

Revenue, cash flow, debits, NSF, POS, loan, and average daily balance — Capital Infusion OCR

Revenue (True Revenue)

```
true_revenue = total_credits − lender_credits
```

- **total_credits** — sum of deposit/credit transactions. Preference order: bank-printed summary total, then parsed-transaction sum, then the higher of raw vs. cleaned dataframe.
- **lender_credits** — incoming MCA/lender funding deposits (not real revenue), matched by keyword and funding-pattern detection.

Across N statements: true_revenue = Σ(credits) − Σ(lender_credits)

Cash Flow

```
cash_flow = total_credits − total_debits
```

Net of all money in vs. out, including lender activity (unlike true revenue).

Debits & Withholding Rate

```
total_debits = Σ Debit column
```

```
withholding_rate = (lender_debits / true_revenue) × 100
```

Lender debits are first normalized to a monthly obligation:

```
monthly_debit = median(payments) × 4.33     if payments recur weekly
              = sum(payments)              otherwise
```

4.33 = 52 weeks ÷ 12 months. Frequency is inferred from date gaps: weekly if most fall 5–9 days apart, monthly if 25–35 days apart.

NSF Count

```
nsf_count = max(description_matches, returned_item_section_matches)
```

Description matches: NSF, NON-SUFFICIENT FUNDS, INSUFFICIENT FUNDS, OVERDRAFT FEE, RETURNED ITEM FEE, RETURN FEE, ITEMS RETURNED UNPAID

Returned-item matches count dated lines inside a raw "Items returned unpaid" section. The higher source wins.

POS Count

Count of transactions matching: CARD PURCHASE, CHECKCARD, POS, INTERAC PURCHASE, DEBIT CARD PURCHASE, POINT OF SALE

Loan Count

Count of transactions matching: LOAN, MORTGAGE/MORTG, LINE OF CREDIT, LOC PMT/PYMT/PAY, SBA
